

- 3) A researcher seeks to show that there is a home-country advantage in winning medals in the olympics. The following chart plots Y: The number of medals won by the United States as a percentage of the total number of medals available to be won. Versus X: The year of the olympic. A ■ in the graph represents a home game (olympics in US), a ● in the graph represents an away game. (There are 12 olympics in the data) While we cannot read the actual Y scores off the graph, we can still carry out a non-parametric test to see if the average percentages are higher for the home games. Carry out the test, and give its p-value.
